1. HashMap

HashMap stores entries in buckets and preserves average constant lookup time.

- Capacity grows when the resize threshold is reached

```
if (binCount >= TREEIFY_THRESHOLD) treeifyBin(table, hash);
```

Property	Value
initialCapacity	16
resizeThreshold	12

The next page continues the same HashMap chapter before a new subsection.

1.1 Treeification

A collision chain can become a red black tree after the threshold is reached.
